

Biological maturity & relative age

Squad results — three Danish youth teams

Biological maturity estimated using the Khamis-Roche method:

$\%PAH = (\text{current height} / \text{predicted adult height}) \times 100$,
where PAH is predicted from current height, current weight,
and adjusted mid-parental height.

Relative age expressed as birth month and calendar-year quartile.

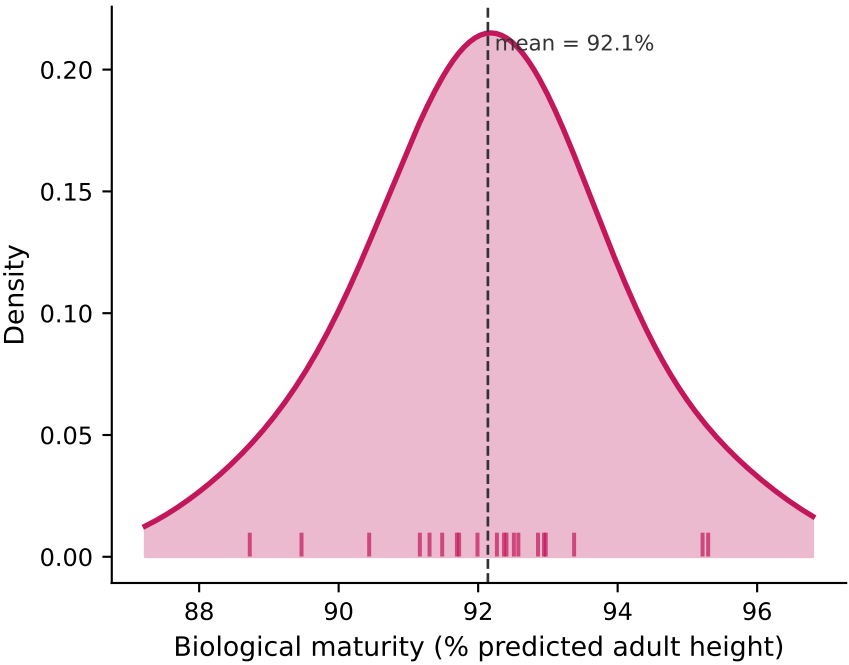

Contents:

1. Women's Football U14
2. Ice Hockey U16
3. Elite Soccer U16

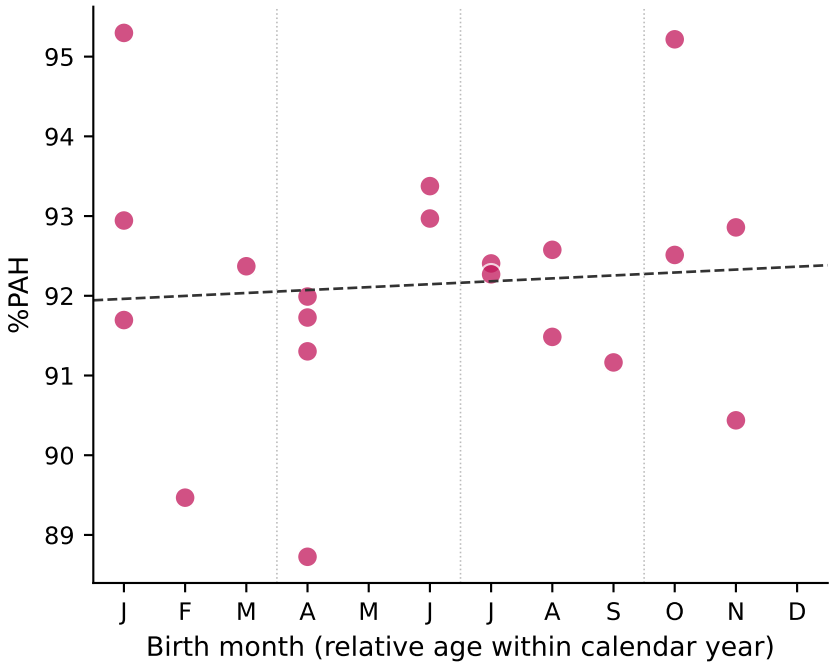

Women's Football U14

$n = 20$ | mean %PAH = 92.1% | Q1+Q2 share = 55%

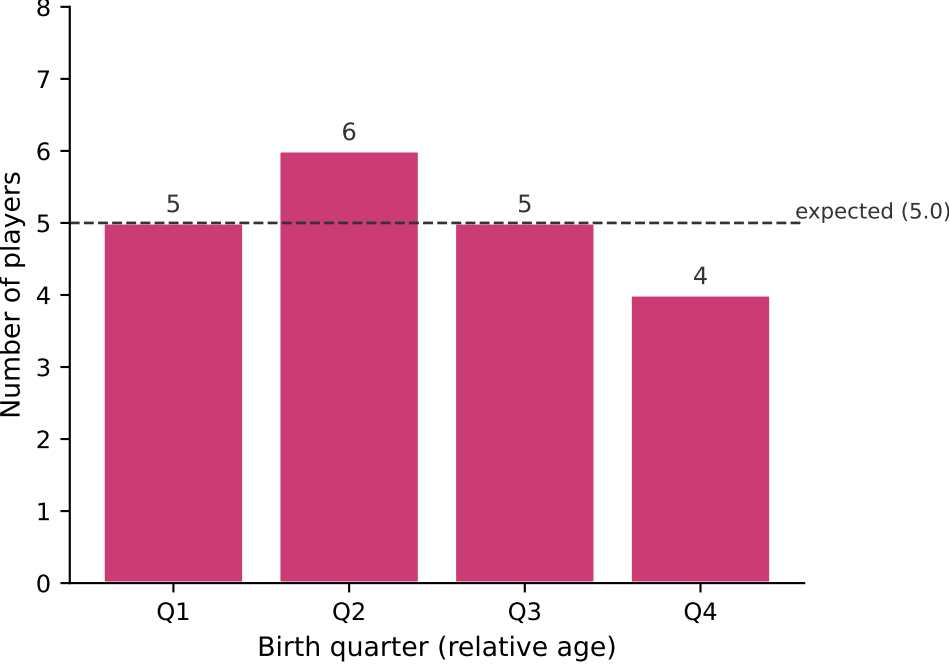

Biological maturity distribution

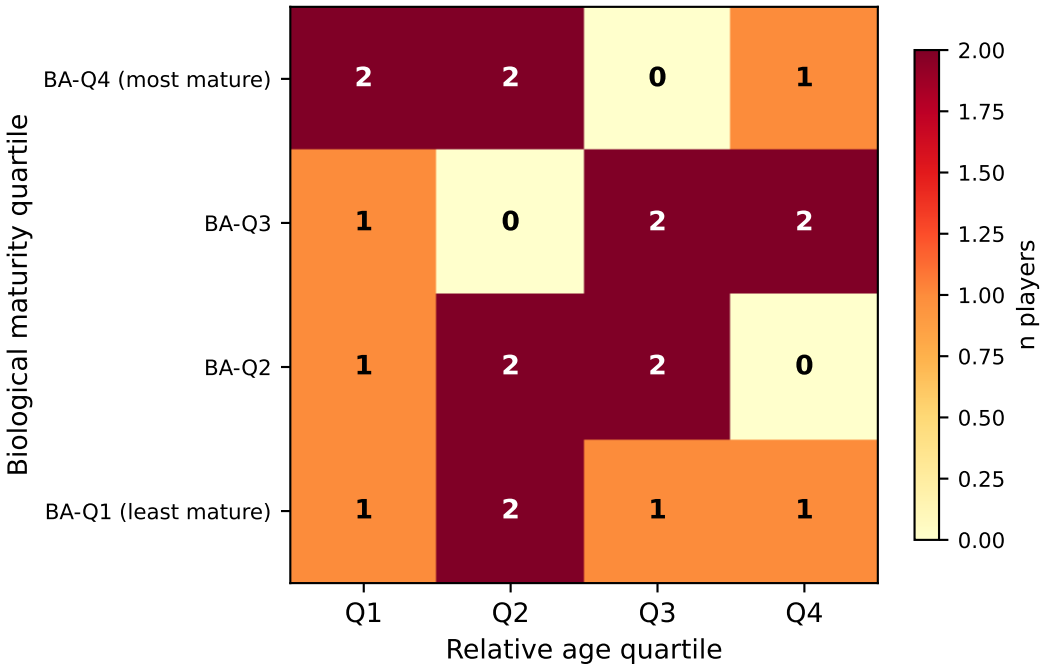

Biological maturity vs. relative age

Players per relative age quartile

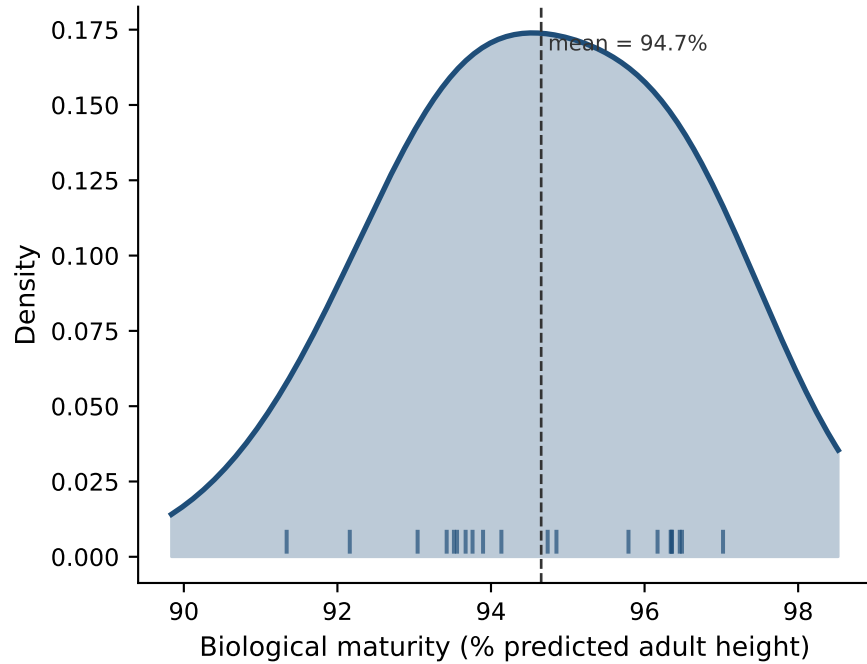

Relative age × biological maturity

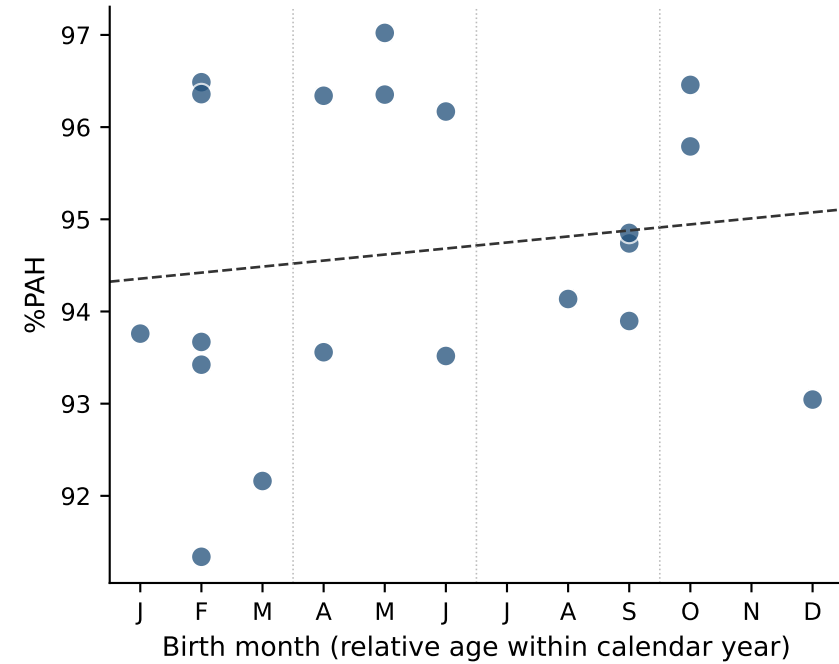

Ice Hockey U16

$n = 20$ | mean %PAH = 94.7% | Q1+Q2 share = 65%

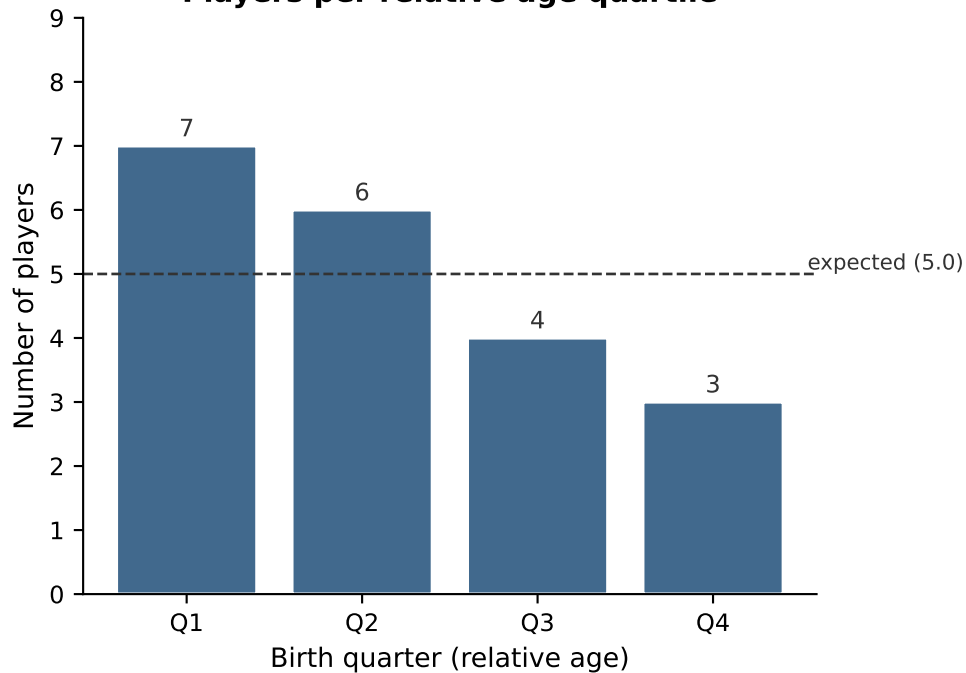

Biological maturity distribution

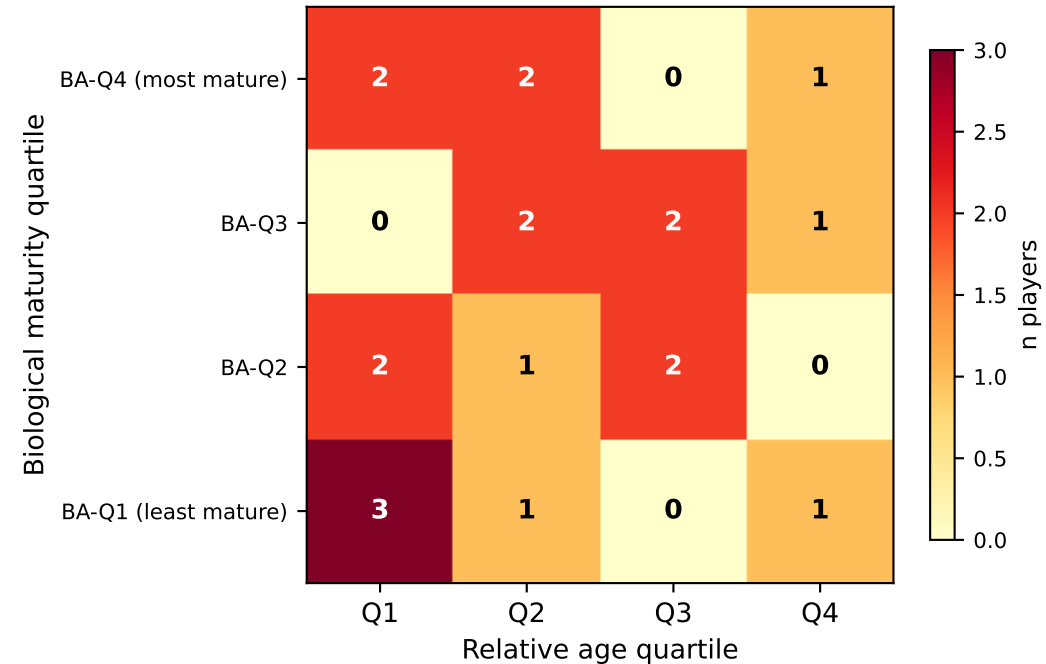

Biological maturity vs. relative age

Players per relative age quartile

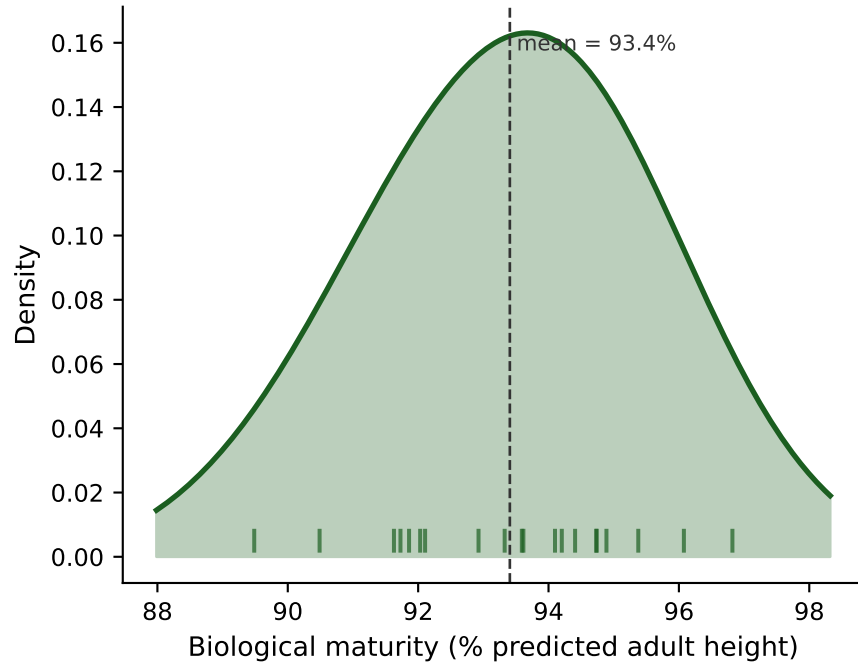

Relative age × biological maturity

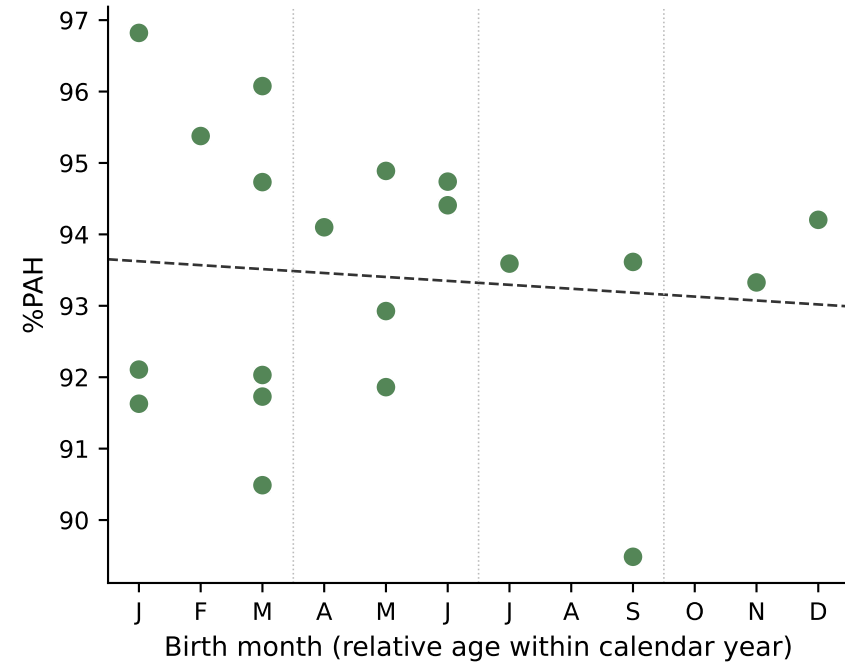

Elite Soccer U16

$n = 20$ | mean %PAH = 93.4% | Q1+Q2 share = 75%

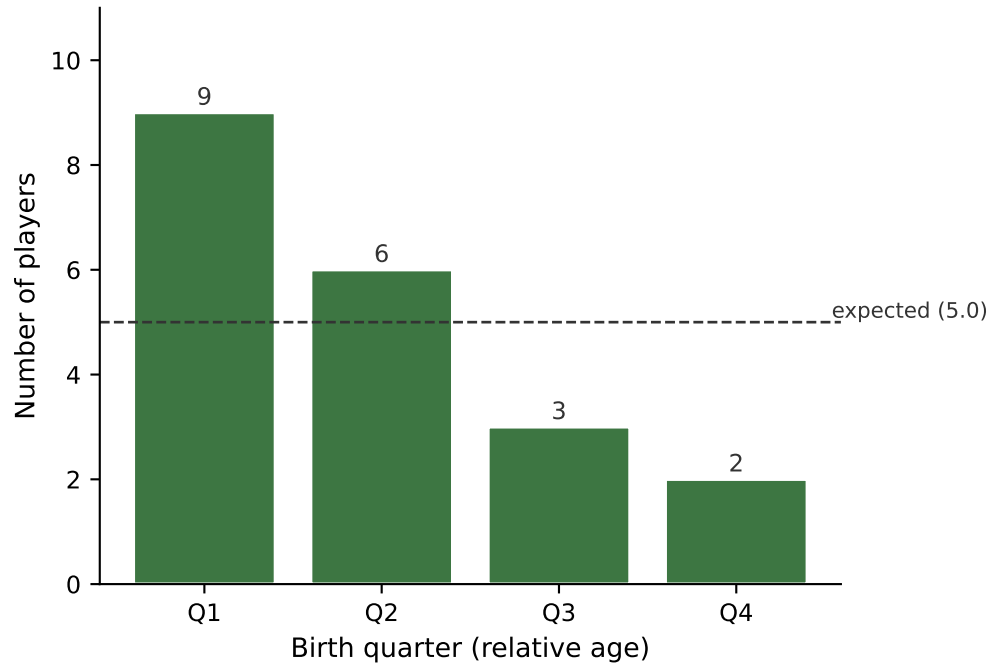

Biological maturity distribution

Biological maturity vs. relative age

Players per relative age quartile

Relative age × biological maturity
